## Wiring diagram

## Functional principle

The inclinometers use an acceleration measuring cell to determine the angle. The Earth's gravity is used as a reference. If the inclinometer changes its angle relative to the Earth's gravity, this is detected by the acceleration measuring cell. The signal is then linearized so that a value proportional to the angle is output.
The measuring principle used makes mounting and commissioning the device easy. The robust sensors are positioned with the

cast side on a flat surface so that the casting compound is covered. The sensor is then secured with two screws.
The sensor can also record the temperature, which can be used to monitor the condition of the machine.

## Mounting instructions

## Mounting instructions/Description

The measuring principle enables simple mounting and commissioning, for example because a metal environment does not interfere with the measuring principle. A green LED indicates whether the sensor is being supplied properly. The green flashing LED indicates that IO-Link communication is active.
One yellow LED per inclination axis acts as a zero position indicator to aid commissioning. It is constantly illuminated when the position of the inclinometer is in a window of $\pm 0.5^{\circ}$ around the center point. The LED flashes with increasing frequency the more the sensor approaches the center point position.
